SYNCHRONOUS DRAM MODULE

MT8LSDT864A, MT16LSDT1664A

For the latest data sheet, please refer to the Micron Web site: www.micron.com/mti/msp/html/datasheet.html

FEATURES

- PC66-, PC100- and PC133-compliant
- JEDEC-standard 168-pin, dual in-line memory module (DIMM)
- Utilizes 100 MHz, 125 MHz and 133 MHz SDRAM components
- Unbuffered
- 64MB (8 Meg x 64) and 128MB (16 Meg x 64)
- Single +3.3V ±0.3V power supply
- Fully synchronous; all signals registered on positive edge of system clock
- Internal pipelined operation; column address can be changed every clock cycle
- Internal SDRAM banks for hiding row access/ precharge
- Programmable burst lengths: 1, 2, 4, 8 or full page
- Auto Precharge, includes CONCURRENT AUTO PRECHARGE, and Auto Refresh Modes
- Self Refresh Mode
- 64ms, 4,096-cycle refresh
- LVTTL-compatible inputs and outputs
- Serial Presence-Detect (SPD)

OPTIONS — MARKING

- Operating Temperature Range
  - Commercial (-0°C to +70°C) — G
  - Extended (-40°C to +85°C) — I
- Frequency/CAS Latency
  - 133 MHz/CL = 2 (7.5, 133MHz SDRAMs) — -13E
  - 133 MHz/CL = 3 (7.5ns, 133 MHz SDRAMs) — -133
  - 100 MHz/CL = 2 (8ns, 125 MHz SDRAMs) — -10E
  - 66 MHz/CL = 2 (10ns, 100 MHz SDRAMs) — -662

KEY SDRAM COMPONENT TIMING PARAMETERS

MODULE MARKING	SPEED GRADE	CAS LATENCY	ACCESS TIME	SETUP TIME	HOLD TIME
-13E	-7E	2	5.4ns	1.5ns	0.8ns
-133	-75	3	5.4ns	1.5ns	0.8ns
-10E	-8E	2	6ns	2ns	1ns
-662	-10	2	9ns	3ns	1ns

NOTE: All part numbers end with a two-place code (not shown), designating component and PCB revisions. Consult factory for current revision codes. Example: MT8LSDT864AG-10EB4.

GENERAL DESCRIPTION

The MT8LSDT864A and MT16LSDT1664A are high-speed CMOS, dynamic random-access, 64MB and 128MB memories organized in a x64 configuration. These modules use internally configured quad-bank SDRAMs with a synchronous interface (all signals are registered on the positive edge of the clock signals CK0-CK3).

Read and write accesses to the SDRAM modules are burst oriented; accesses start at a selected location and continue for a programmed number of locations in a programmed sequence. Accesses begin with the registration of an ACTIVE command, which is then followed by a READ or WRITE command. The address bits registered coincident with the ACTIVE command are used to select the bank and row to be accessed (BA0, BA1 select the bank, A0-A11 select the row). The address bits registered coincident with the READ or WRITE command are used to select the starting column location for the burst access.

These modules provide for programmable READ or WRITE burst lengths of 1, 2, 4 or 8 locations, or the full page, with a burst terminate option. An auto precharge function may be enabled to provide a self-timed row precharge that is initiated at the end of the burst sequence.

These modules use an internal pipelined architecture to achieve high-speed operation. This architecture is compatible with the 2*n* rule of prefetch architectures, but it also allows the column address to be changed on every clock cycle to achieve a high-speed, fully random access. Precharging one bank while accessing one of the other three banks will hide the precharge cycles and provide seamless, high-speed, random-access operation.

These modules are designed to operate in 3.3V, low-power memory systems. An auto refresh mode is provided, along with a power-saving, power-down mode. All inputs and outputs are LVTTL-compatible.

SDRAM modules offer substantial advances in DRAM operating performance, including the ability to synchronously burst data at a high data rate with automatic column-address generation, the ability to interleave between internal banks in order to hide precharge time and the capability to randomly change column addresses on each clock cycle during a burst access. For more information regarding SDRAM operation, refer to the 64Mb x4, x8, x16 SDRAM data sheet.

SERIAL PRESENCE-DETECT OPERATION

These modules incorporate serial presence-detect (SPD). The SPD function is implemented using a 2,048-bit EEPROM. This nonvolatile storage device contains 256 bytes. The first 128 bytes can be programmed by Micron to identify the module type and various SDRAM organizations and timing parameters. The remaining 128 bytes of storage are available for use by the customer. System READ/WRITE operations between the master (system logic) and the slave EEPROM device (DIMM) occur via a standard IIC bus using the DIMM's SCL (clock) and SDA (data) signals, together with SA(2:0), which provide eight unique DIMM/EEPROM addresses.

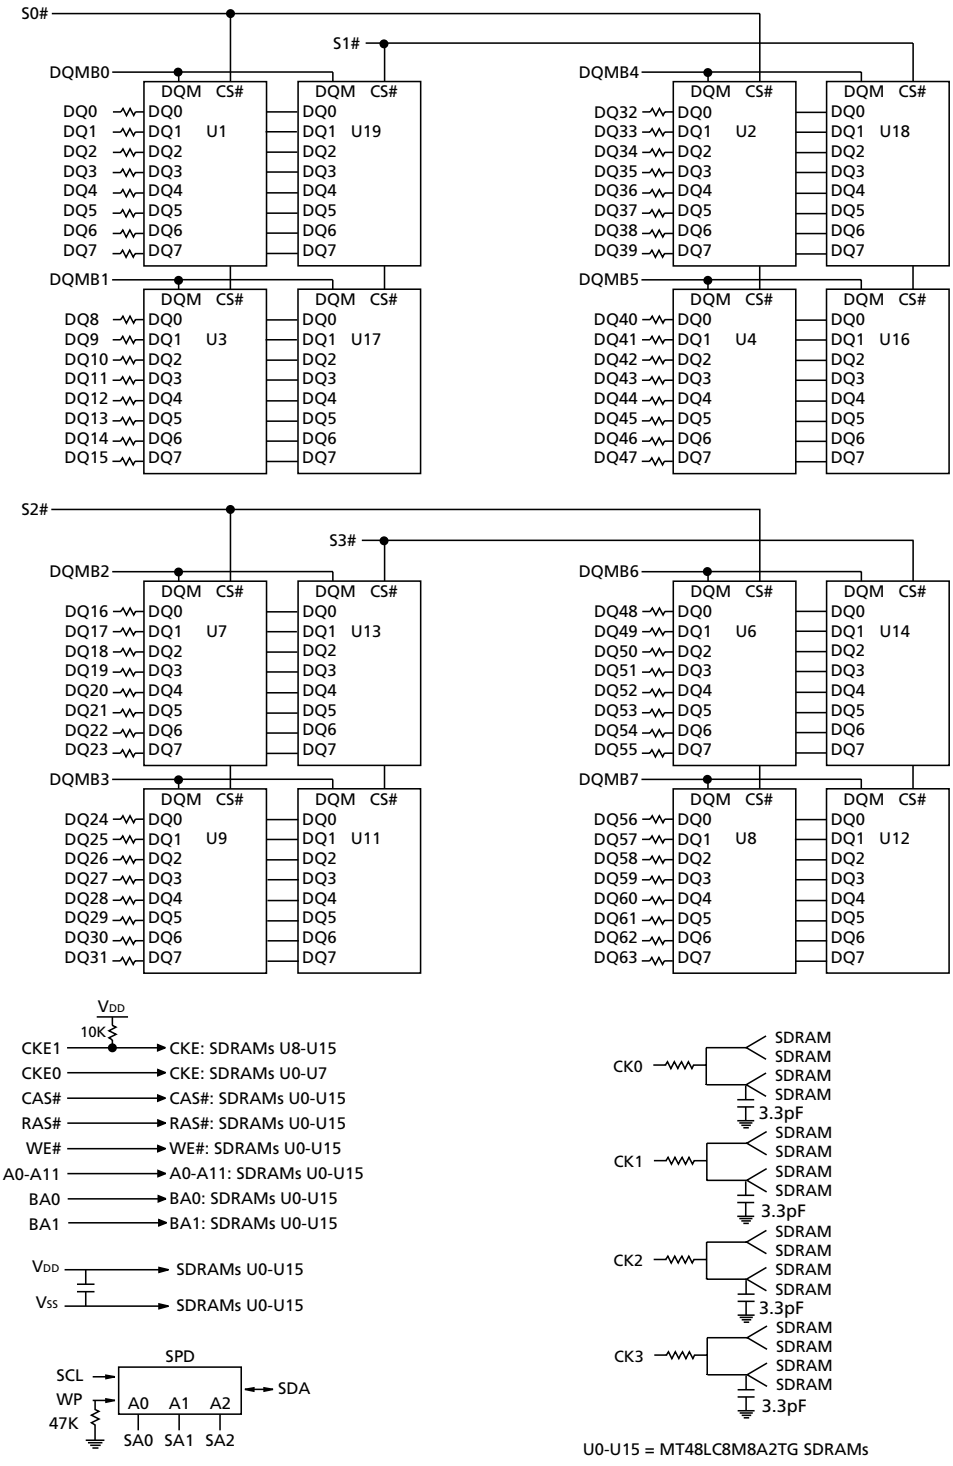
NOTE: All resistor values are 10 ohms.

FUNCTIONAL BLOCK DIAGRAM
MT16LSDT1664A (128MB)



NOTE: All resistor values are 10 ohms unless otherwise specified.

PIN DESCRIPTIONS

PIN NUMBERS	SYMBOL	TYPE	DESCRIPTION
115, 111, 27	RAS#, CAS#, WE#	Input	Command Inputs: RAS#, CAS# and WE# (along with S0#-S3#) define the command being entered.
42, 79, 125, 163	CK0-CK3	Input	Clock: CK0-CK3 are driven by the system clock. All SDRAM input signals are sampled on the positive edge of CK. CK also increments the internal burst counter and controls the output registers.
63, 128	CKE1, CKE0	Input	Clock Enable: CKE0-CKE1 activate (HIGH) and deactivate (LOW) the CK0-CK3 signals. Deactivating the clock provides PRECHARGE POWER-DOWN and SELF REFRESH operation (all banks idle), ACTIVE POWER-DOWN (row ACTIVE in any bank) or CLOCK SUSPEND operation (burst access in progress). CKE0-CKE1 are synchronous except after the device enters power-down and self refresh modes, where CKE0-CKE1 become asynchronous until after exiting the same mode. The input buffers, including CK0-CK3, are disabled during power-down and self refresh modes, providing low standby power.
30, 45, 114, 129	S0#-S3#	Input	Chip Select: S0#-S3# enable (registered LOW) and disable (registered HIGH) the command decoder. All commands are masked when S0#-S3# are registered HIGH. S0#-S3# are considered part of the command code.
28-29, 46-47, 112-113, 130-131	DQMB0-DQMB7	Input	Input/Output Mask: DQMB is an input mask signal for write accesses and an output enable signal for read accesses. Input data is masked when DQMB is sampled HIGH during a WRITE cycle. The output buffers are placed in a High-Z state (two-clock latency) when DQMB is sampled HIGH during a READ cycle.
39, 122	BA0, BA1	Input	Bank Address: BA0 and BA1 define to which bank the ACTIVE, READ, WRITE or PRECHARGE command is being applied.
33-38, 117-121, 123	A0-A11	Input	Address Inputs: A0-A11 are sampled during the ACTIVE command (row-address A0-A11) and READ/WRITE command (column-address A0-A8, with A10 defining AUTO PRECHARGE) to select one location out of the memory array in the respective bank. A10 is sampled during a PRECHARGE command to determine if all banks are to be precharged (A10 HIGH) or bank selected by BA0, BA1 (LOW). The address inputs also provide the op-code during a LOAD MODE REGISTER command.
81	WP	Input	Write Protect: Serial presence-detect hardware write protect. Applies to -10E/-10C versions only.
83	SCL	Input	Serial Clock for Presence-Detect: SCL is used to synchronize the presence-detect data transfer to and from the module.
165-167	SA0-SA2	Input	Presence-Detect Address Inputs: These pins are used to configure the presence-detect device.

PIN DESCRIPTIONS (continued)

PIN NUMBERS	SYMBOL	TYPE	DESCRIPTION
2-5, 7-11, 13-17, 19-20, 55-58, 60, 65-67, 69-72, 74-77, 86-89, 91-95, 97-101, 103-104, 139-142, 144, 149-151, 153-156, 158-161	DQ0-DQ63	Input/ Output	Data I/Os: Data bus.
82	SDA	Input/ Output	Serial Presence-Detect Data: SDA is a bidirectional pin used to transfer addresses and data into and data out of the presence-detect portion of the module.
6, 18, 26, 40, 41, 49, 59, 73, 84, 90, 102, 110, 124, 133, 143, 157, 168	V_{DD}	Supply	Power Supply: +3.3V ±0.3V.
1, 12, 23, 32, 43, 54, 64, 68, 78, 85, 96, 107, 116, 127, 138, 148, 152, 162	V_{SS}	Supply	Ground.
126, 132	RFU	–	Reserved for Future Use: These pins should be left unconnected.
31, 44, 48	DNU	–	Do Not Use: These pins are not connected on these modules but are assigned pins on the compatible DRAM version.

SPD CLOCK AND DATA CONVENTIONS

Data states on the SDA line can change only during SCL LOW. SDA state changes during SCL HIGH are reserved for indicating start and stop conditions (Figures 1 and 2).

SPD START CONDITION

All commands are preceded by the start condition, which is a HIGH-to-LOW transition of SDA when SCL is HIGH. The SPD device continuously monitors the SDA and SCL lines for the start condition and will not respond to any command until this condition has been met.

SPD STOP CONDITION

All communications are terminated by a stop condition, which is a LOW-to-HIGH transition of SDA when SCL is HIGH. The stop condition is also used to place the SPD device into standby power mode.

SPD ACKNOWLEDGE

Acknowledge is a software convention used to indicate successful data transfers. The transmitting device, either master or slave, will release the bus after transmitting eight bits. During the ninth clock cycle, the receiver will pull the SDA line LOW to acknowledge that it received the eight bits of data (Figure 3).

The SPD device will always respond with an acknowledge after recognition of a start condition and its slave address. If both the device and a WRITE operation have been selected, the SPD device will respond with an acknowledge after the receipt of each subsequent eight bit word. In the read mode the SPD device will transmit eight bits of data, release the SDA line and monitor the line for an acknowledge. If an acknowledge is detected and no stop condition is generated by the master, the slave will continue to transmit data. If an acknowledge is not detected, the slave will terminate further data transmissions and await the stop condition to return to standby power mode.

COMMANDS

Truth Table 1 provides a general reference of available commands. For a more detailed description of commands and operations, refer to the 64Mb x4, x8, x16 SDRAM data sheet.

TRUTH TABLE 1 – COMMANDS AND DQMB OPERATION

(Note: 1)

NAME (FUNCTION)	CS#	RAS#	CAS#	WE#	DQMB	ADDR	DQs	NOTES
COMMAND INHIBIT (NOP)	H	X	X	X	X	X	X	
NO OPERATION (NOP)	L	H	H	H	X	X	X	
ACTIVE (Select bank and activate row)	L	L	H	H	X	Bank/Row	X	3
READ (Select bank and column, and start READ burst)	L	H	L	H	L/H[8]	Bank/Col	X	4
WRITE (Select bank and column, and start WRITE burst)	L	H	L	L	L/H[8]	Bank/Col	Valid	4
BURST TERMINATE	L	H	H	L	X	X	Active	
PRECHARGE (Deactivate row in bank or banks)	L	L	H	L	X	Code	X	5
AUTO REFRESH or SELF REFRESH (Enter self refresh mode)	L	L	L	H	X	X	X	6, 7
LOAD MODE REGISTER	L	L	L	L	X	Op-Code	X	2
Write Enable/Output Enable	–	–	–	–	L	–	Active	8
Write Inhibit/Output High-Z	–	–	–	–	H	–	High-Z	8

NOTE:
1. CKE is HIGH for all commands shown except SELF REFRESH.
2. A0-A11 define the op-code written to the Mode Register.
3. A0-A11 provide row address, and BA0, BA1 determine which bank is made active.
4. A0-A8 provide column address; A10 HIGH enables the auto precharge feature (nonpersistent), while A10 LOW disables the auto precharge feature; BA0, BA1 determine which bank is being read from or written to.
5. A10 LOW: BA0, BA1 determine which bank is being precharged. A10 HIGH: all banks are precharged and BA0, BA1 are "Don't Care."
6. This command is AUTO REFRESH if CKE is HIGH, SELF REFRESH if CKE is LOW.
7. Internal refresh counter controls row addressing; all inputs and I/Os are "Don't Care" except for CKE.
8. Activates or deactivates the DQs during WRITEs (zero-clock delay) and READs (two-clock delay).

Full Page (y)	n = A0-A8 (location 0-y)	Cn, Cn + 1, Cn + 2 Cn + 3, Cn + 4... …Cn - 1, Cn…	Not supported

NOTE:
1. For full-page accesses: y = 512.
2. For a burst length of two, A1-A8 select the block-of-two burst; A0 selects the starting column within the block.
3. For a burst length of four, A2-A8 select the block-of-four burst; A0-A1 select the starting column within the block.
4. For a burst length of eight, A3-A8 select the block-of-eight burst; A0-A2 select the starting column within the block.
5. For a full-page burst, the full row is selected, and A0-A8 select the starting column.
6. Whenever a boundary of the block is reached within a given sequence above, the following access wraps within the block.
7. For a burst length of one, A0-A8 select the unique column to be accessed, and Mode Register bit M3 is ignored.

ABSOLUTE MAXIMUM RATINGS*

Voltage on V_{DD} Supply Relative to V_{SS} .... -1V to +4.6V
Voltage on Inputs, NC or I/O Pins
Relative to V_{SS} ..... -1V to +4.6V
Operating Temperature, T_A (ambient) ... 0°C to +70°C
Storage Temperature (plastic) ..... -55°C to +125°C
Power Dissipation 8W

*Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

DC ELECTRICAL CHARACTERISTICS AND OPERATING CONDITIONS

(Notes: 1,2) (V_{DD} = +3.3V ±0.3V)

PARAMETER/CONDITION		SYMBOL	MIN	MAX	UNITS	NOTES
SUPPLY VOLTAGE		V_{DD}	3	3.6	V	
INPUT HIGH VOLTAGE: Logic 1; All inputs		V_{IH}	2	V_{DD} + 0.3	V	3
INPUT LOW VOLTAGE: Logic 0; All inputs		V_{IL}	-0.5	0.8	V	3
INPUT LEAKAGE CURRENT: Any input 0V ≤ V_{IN} ≤ V_{DD} (All other pins not under test = 0V)	DQMB0-DQMB7	I_{I1}	-10	10	µA	4
	CK0-CK3, S0#-S3#	I_{I2}	-20	20	µA	
	CKE0-CKE1	I_{I3}	-40	40	µA	
	RAS#, CAS#, A0-A11, BA0-BA1, WE#	I_{I4}	-80	80	µA	4
OUTPUT LEAKAGE CURRENT: DQs are disabled; 0V ≤ V_{OUT} ≤ V_{DD}	DQ0-DQ63	I_{OZ}	-10	10	µA	4
OUTPUT LEVELS: Output High Voltage (I_{OUT} = -4mA)		V_{OH}	2.4	–	V	
Output Low Voltage (I_{OUT} = 4mA)		V_{OL}	–	0.4	V	

NOTE:
1. All voltages referenced to V_{SS}.
2. An initial pause of 100µs is required after power-up, followed by two AUTO REFRESH commands, before proper device operation is ensured. The two AUTO REFRESH command wake-ups should be repeated any time the ^{t}REF refresh requirement is exceeded.
3. V_{IH} overshoot: V_{IH} (MAX) = V_{DD} + 2V for a pulse width ≤ 10ns, and the pulse width cannot be greater than one third of the cycle rate. V_{IL} undershoot: V_{IL} (MIN) = -2V for a pulse width ≤ 10ns, and the pulse width cannot be greater than one third of the cycle rate.
4. 64MB module values will be half of those shown.

IDD SPECIFICATIONS AND CONDITIONS

(Notes: 1-4) (V_{DD} = +3.3V ±0.3V)

				MAX					
PARAMETER/CONDITION		SYMBOL	SIZE	-13E	-133	-10E	-662	UNITS	NOTES
OPERATING CURRENT: Active Mode; Burst = 2; READ or WRITE; tRC = tRC (MIN); CAS latency = 3		IDD1	64MB	1,000	920	760	720	mA	5, 6, 7, 8
			128MB	1,360	1,280	1,040	960		
STANDBY CURRENT: Power-Down Mode; CKE = LOW; All banks idle		IDD2	64MB	16	16	16	24	mA	8
			128MB	32	32	32	48		
STANDBY CURRENT: Active Mode; S0#-S3# = HIGH; CKE = HIGH; All banks active after tRCD met; No accesses in progress		IDD3	64MB	360	360	280	240	mA	5, 9, 7, 8
			128MB	720	720	560	480		
OPERATING CURRENT: Burst Mode; Continuous burst; READ or WRITE; All banks active; CAS latency = 3		IDD4	64MB	1,200	1,120	960	840	mA	5, 6, 7, 8
			128MB	1,560	1,480	1,240	1,080		
AUTO REFRESH CURRENT: CKE = HIGH; S0#-S3# = HIGH	tRC = tRC (MIN); CL = 3	IDD5	64MB	1,840	1,680	1,520	1,360	mA	5, 6, 7, 8, 9, 10
			128MB	2,200	2,040	1,800	1,600		
	tRC = 15.625µs; CL = 3	IDD6	64MB	24	24	24	24	mA	
			128MB	48	48	48	48		
SELF REFRESH CURRENT: CKE ≤ 0.2V		IDD7	64MB	8	8	8	16	mA	11
			128MB	16	16	16	32		

NOTE:
1. All voltages referenced to V_{SS}.
2. An initial pause of 100µs is required after power-up, followed by two AUTO REFRESH commands, before proper device operation is ensured. The two AUTO REFRESH command wake-ups should be repeated any time the tREF refresh requirement is exceeded.
3. AC timing and IDD tests have V_{IL} = 0V and V_{IH} = 3V, with timing referenced to 1.5V crossover point. If the input transition time is longer than 1ns, then the timing is referenced at V_{IL} (MAX) and V_{IL} (MIN) and no longer at the 1.5V crosspover point.
4. IDD specifications are tested after the device is properly initialized.
5. IDD is dependent on output loading and cycle rates. Specified values are obtained with minimum cycle time and the outputs open.
6. The IDD current will decrease as the CAS latency is reduced. This is due to the fact that the maximum cycle rate is slower as the CAS latency is reduced.
7. Address transitions average one transition every two clocks.
8. tCK = 7.5ns for -133, 10ns for -10E and 15ns for -662.
9. Other input signals are allowed to transition no more than once every two clocks and are otherwise at valid V_{IH} or V_{IL} levels.
10. CKE is high during refresh command period (tRFC [MIN]) else CKE is low. The IDD6 limit is actually a nominal value and does not result in a fail value.
11. Enables on-chip refresh and address counters.

CAPACITANCE

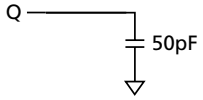
*Specifications for the SDRAM components used on the module.

NOTE:
1. The minimum specifications are used only to indicate cycle time at which proper operation over the full temperature range (0°C ≤ T_A ≤ +70°C) is ensured.
2. An initial pause of 100µs is required after power-up, followed by two AUTO REFRESH commands, before proper device operation is ensured. The two AUTO REFRESH command wake-ups should be repeated any time the tREF refresh requirement is exceeded.
3. AC characteristics assume tT = 1ns.
4. In addition to meeting the transition rate specification, the clock and CKE must transit between VIH and VIL (or between VIL and VIH) in a monotonic manner.
5. Outputs measured at 1.5V with equivalent load:



NOTES: (continued)

6. AC timing and I_{DD} tests have V_{IL} = 0V and V_{IH} = 3V, with timing referenced to 1.5V crossover point. If the input transition time is longer than 1ns, then the timing is referenced at V_{IL} (MAX) and V_{IL} (MIN) and no longer at the 1.5V crosspover point.
7. ^{t}AC for -133 at CL = 3 with no load is 4.6ns and is guaranteed by design.
8. The clock frequency must remain constant (stable clock is defined as a signal cycling within timing constraints specified for the clock pin) during access or precharge states (READ, WRITE, including ^{t}WR, and PRECHARGE commands). CKE may be used to reduce the data rate.
9. ^{t}HZ defines the time at which the output achieves the open circuit condition; it is not a reference to V_{OH} or V_{OL}. The last valid data element will meet ^{t}OH before going High-Z.
10. Parameter guaranteed by design.
11. AC characteristics assume ^{t}T = 1ns.
12. Auto precharge mode only. The precharge timing budget (^{t}RP) begins 7.5ns/8ns after the first clock delay, after the last WRITE is executed.
13. Precharge mode only.
14. CK must be toggled a minimum of two times during this period.

AC FUNCTIONAL CHARACTERISTICS

(Notes: 1-6)

PARAMETER		SYMBOL	-133	-13E/ -10E	-662	UNITS	NOTES
READ/WRITE command to READ/WRITE command		tCCD	1	1	1	tCK	7
CKE to clock disable or power-down entry mode		tCKED	1	1	1	tCK	8

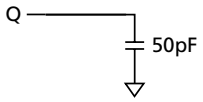
Last data-in to new READ/WRITE command		tCDL	1	1	1	tCK	7
Last data-in to PRECHARGE command		tRDL	2	2	2	tCK	10, 11
LOAD MODE REGISTER command to ACTIVE or REFRESH command		tMRD	2	2	2	tCK	12
Data-out to high-impedance from PRECHARGE command	CL = 3	tROH	3	3	3	tCK	7
	CL = 2	tROH	2	2	2	tCK	7

NOTE:
1. The minimum specifications are used only to indicate cycle time at which proper operation over the full temperature range ($0°C \le T_A \le +70°C$) is ensured.
2. An initial pause of 100µs is required after power-up, followed by two AUTO REFRESH commands, before proper device operation is ensured. The two AUTO REFRESH command wake-ups should be repeated any time the tREF refresh requirement is exceeded.
3. AC characteristics assume tT = 1ns.
4. In addition to meeting the transition rate specification, the clock and CKE must transit between VIH and VIL (or between VIL and VIH) in a monotonic manner.
5. Outputs measured at 1.5V with equivalent load:



6. AC timing and IDD tests have VIL = 0V and VIH = 3V, with timing referenced to 1.5V crossover point. If the input transition time is longer than 1ns, then the timing is referenced at VIL (MAX) and VIL (MIN) and no longer at the 1.5V crosspover point.
7. Required clocks are specified by JEDEC functionality and are not dependent on any timing parameter.
8. Timing actually specified by tCKS; clock(s) specified as a reference only at minimum cycle rate.
9. Timing actually specified by tWR plus tRP; clock(s) specified as a reference only at minimum cycle rate.
10. Based on tCK = 143 MHz for 13E, tCK = 133 MHz for -75, 100 MHz for -10E and 66 MHz for -662.
11. Timing actually specified by tWR.
12. JEDEC and PC100 specify three clocks.

SERIAL PRESENCE-DETECT EEPROM DC OPERATING CONDITIONS

(Note: 1) (V_{DD} = +3.3V ±0.3V)

PARAMETER/CONDITION	SYMBOL	MIN	MAX	UNITS	NOTES
